

Amendments to the Abstract

Please **amend** the Abstract to read.

-- A Universal Mobile Telephone System (UMTS) receiver performs slot synchronization using a received primary synchronization channel (PSCH) ~~(305)~~. Subsequent to completion of slot synchronization, the UMTS receiver performs frame synchronization using a received secondary synchronization channel (SSCH) ~~(320)~~ in such a way that the UMTS receiver uses the received primary synchronization channel (PSCH) to adjust for the presence of frequency offset ~~(325, 330, 335)~~.
